

BOLT SCIENCE

In-House (Company Based) Training Course on Bolting Technology

A training course delivered to Engineers and Designers, at a company's premises, on the technical aspects of bolting.

An outline is presented below of the material covered in the training course. Each person on the course will be provided with a handbook which contains background information to the material presented on the course, including example calculations, tables of thread stress areas, thread shear areas and fastener material strength details. The Course Tutor - Dr Bill Eccles

The course will be presented by Bill Eccles. Prior to forming his company, Bolt Science in 1992, Bill's original background was in Design Engineering. The company is a provider of independent technical expertise in bolted joint technology. Bill has extensive experience in the design, analysis and installation of bolted joints and has published several technical papers on the subject. The work he has completed includes, among other things, fastener and joint failure investigation and the determination of its causes into a number of catastrophic accidents. His experience covers the automotive, marine, aerospace, plant and machine tool industries. He is a Chartered Engineer and has a Doctorate in Engineering on the self-loosening of threaded fasteners. Bill has delivered training courses around the world on the analysis of bolted joints and bolting technology.

Is the drive joint shown likely to fail under the given dynamic loading condition?

What is likely to be the problem and how can the issue be rectified?

What tightening torque should be applied to the fasteners?

Bespoke Training

The training can be modified to suit the particular requirements of a company/organisation. This can be in regard to the fastener sizes discussed, the materials being used, the issues needing to be addressed etc.

Instead of using our standard case studies, the training can incorporate specific problems provided by the client. This can be done on an ad hoc basis during the training or a problem, previously supplied, can be addressed.

Comments on the Training

"This course provided an exceptional insight into bolting technology. It covered a thorough range of topics from fastener design first principles to failure analysis. From an engineer's perspective it is an excellent course delivering a unique insight into a subject that is an often misinterpreted basic engineering fundamental. The engineers who attended from BAE Systems found the course extremely valuable, gained a great deal of knowledge over the 2 days and ranked it as a superb, informative course."

'It is amazing how much from the course we are able to apply on a daily basis.'

Typical Questions Addressed in the Training

Can it be anticipated that the joint will fail due to:

- Insufficient preload?
- Bolt Fatigue Failure?
- Thread Stripping?
- The bolts/nuts self-loosening?
- Bolt Overload?
- Thread Stripping?

If there is a problem identified, how can joint be modified so that it will be fit for purpose?

How do you quantify in a calculation methodology the bolt preload scatter associated with the tightening process?

How can the effects of joint relaxation be quantified at the design stage?

Do I really need to use some kind of locking device?

What tightening torque should be applied to a fastener? How can this be established without testing? What tests can be completed? Should the nut or bolt be tightened, or does it not matter?

Why a stronger bolt is not necessarily better?

Is it better for a bolt to fail by tensile fracture during the tightening process or sustain thread stripping?

What are the advantages in using other tightening methods rather than torque control?

What ways can be used to check the 'tightness' of a previously tightened fastener?

Under what specific circumstances does a fastener self-loosen and how can it be prevented?

Why are many locking devices that research indicates are ineffective, still being used?
